

Input Representation

Input / I

The masking strategy is analogous to Mask Language Model (MLM) as in BERT. But, it's different from the BERT model. The masking strategy includes: sliding window and binning. The transformer model predicts the masked value, but doesn't use the predicted masked values in the loss function instead we use contrastive loss for a different goal.

NT-Xent Loss
as used in SimCLR
but we have used
NT-BXent loss
